

Automated Trading with MATLAB[®]

Stuart Kozola
Computational Finance

Challenges when developing and implementing trading strategies and systems

- Increasing complexity
 - More data
 - More complicated models
 - Integration and implementation to multiple system
- Increasing computational speed
 - Push to higher frequency
 - Changes in hardware
- Long deployment cycle
 - (Re)coding is costly and error-prone
 - Multiple system interfaces to consider

Agenda

- Trading system demonstration
- Developing an automated trading decision engine
 - Identify a successful trading rule
 - Extend trading rule set
 - Automate trading rule selection
- Implementing an automated trading system
 - Testing (paper trading) the system
 - Integration and execution through a desktop trading system
 - Execution through a server based system (FIX)
- Wrap up and Q&A

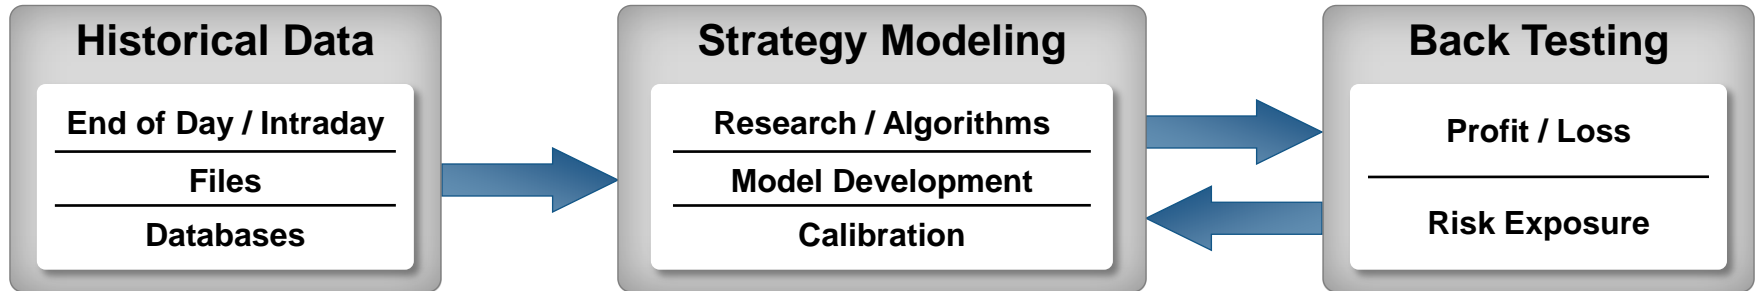

The problem at hand: Identifying and implementing profitable trading strategies

- Commodities analyst
- Developing a trading strategy
 - Multiple trading rules
 - High frequency
- Management requirements:
 - Tested on historical data
 - Uses sophisticated analytics to identify optimal trading rule combination
 - Integrates with existing data and execution APIs

Trading decision engine

Development and testing

Implementation

Requirements for the trading engine

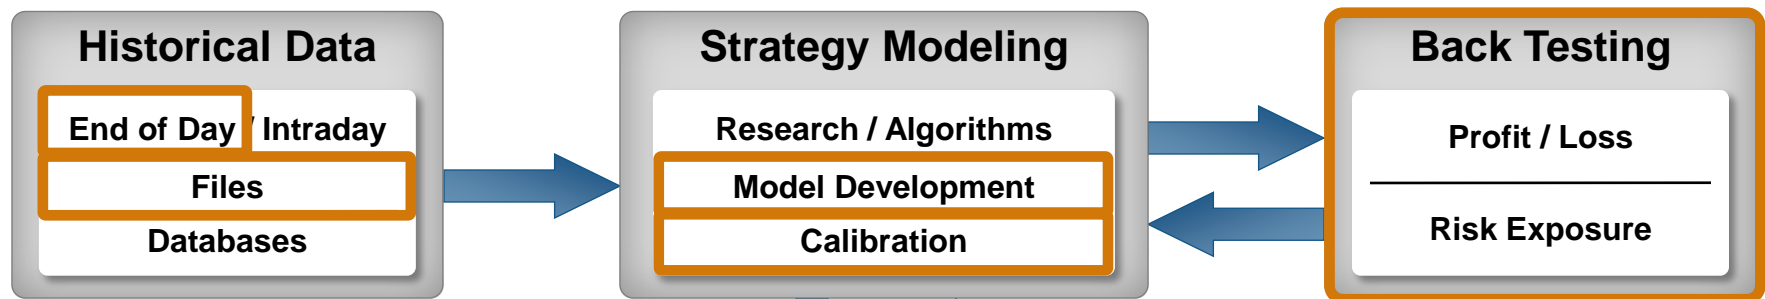

- Sophisticated analytics
 - Custom rules & indicators
 - Non-traditional techniques
- Scalable speed
 - Higher frequency data
 - More trading rules
- Quick to develop and deploy
 - Try different strategies
 - Embed in trading engine

Task 1: Develop a back testing environment

Goal: Build a back testing environment around historical data and a preliminary trading rule

Development and testing

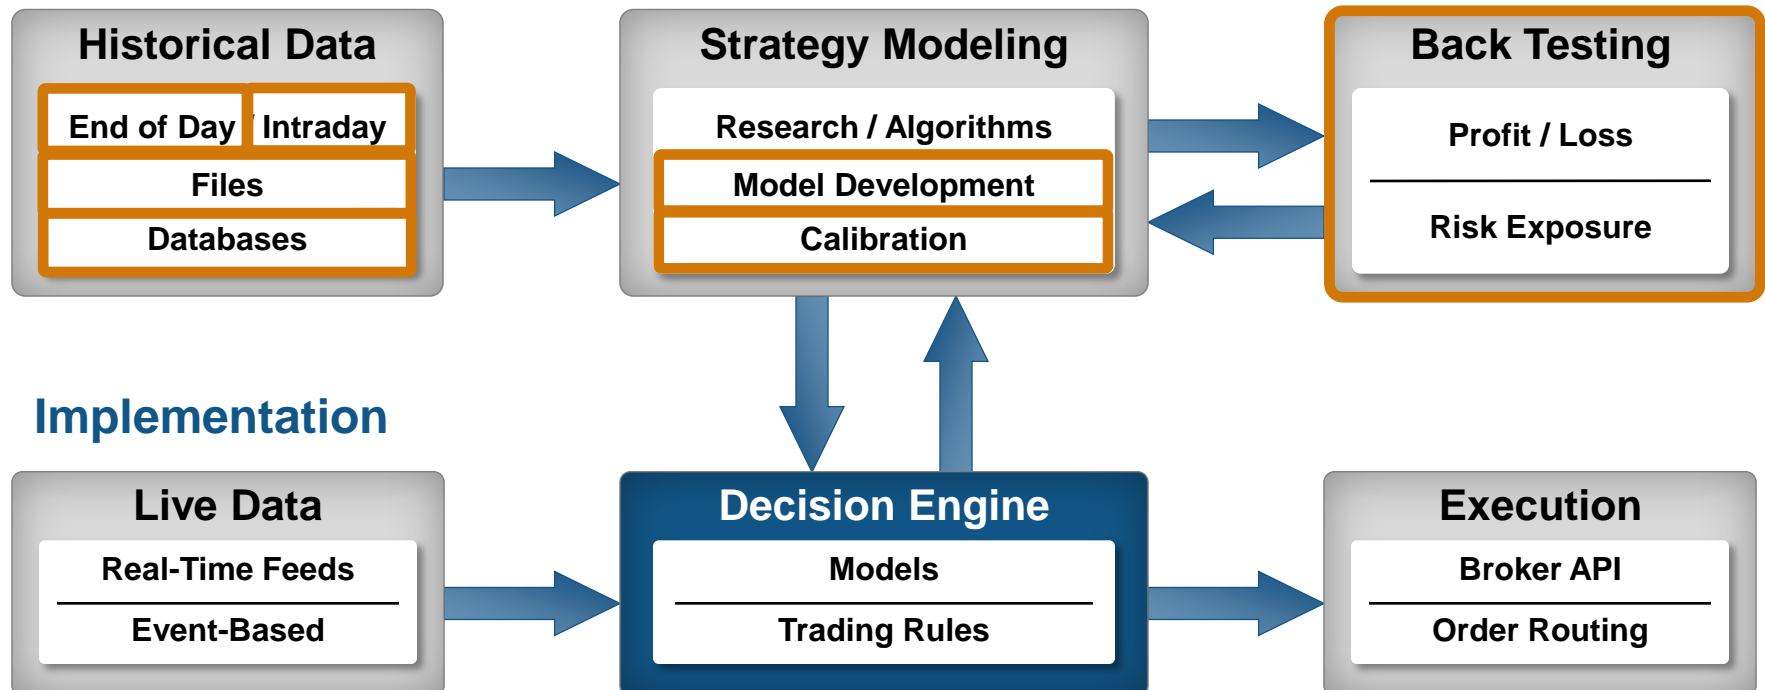

Implementation

Task 2: Deployment of the engine

Goal: Move to a higher frequency (minute-by-minute) and re-calibrate the model

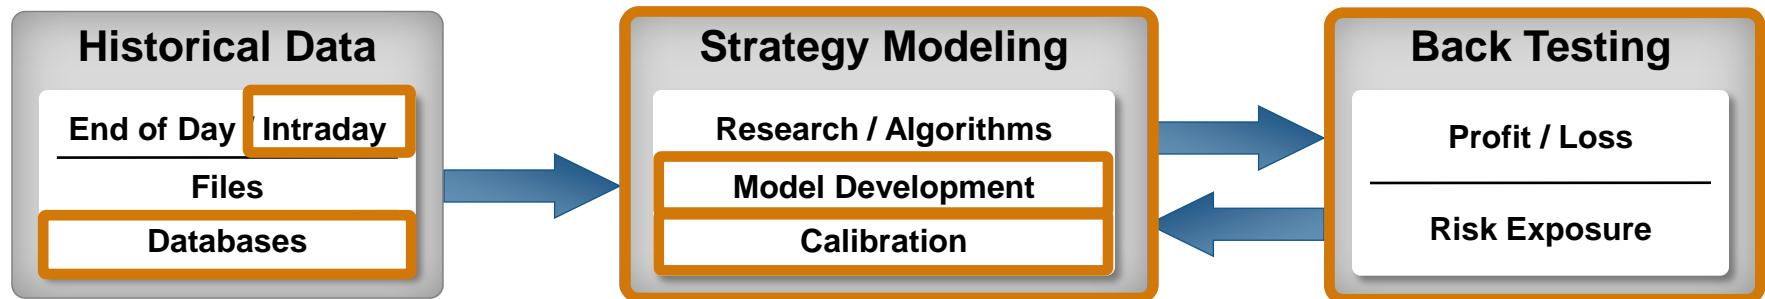

Development and testing

Task 2: Expand decision logic in the engine

Goal: Develop a rule selection system for instruments using evolutionary learning

Development and testing

Implementation

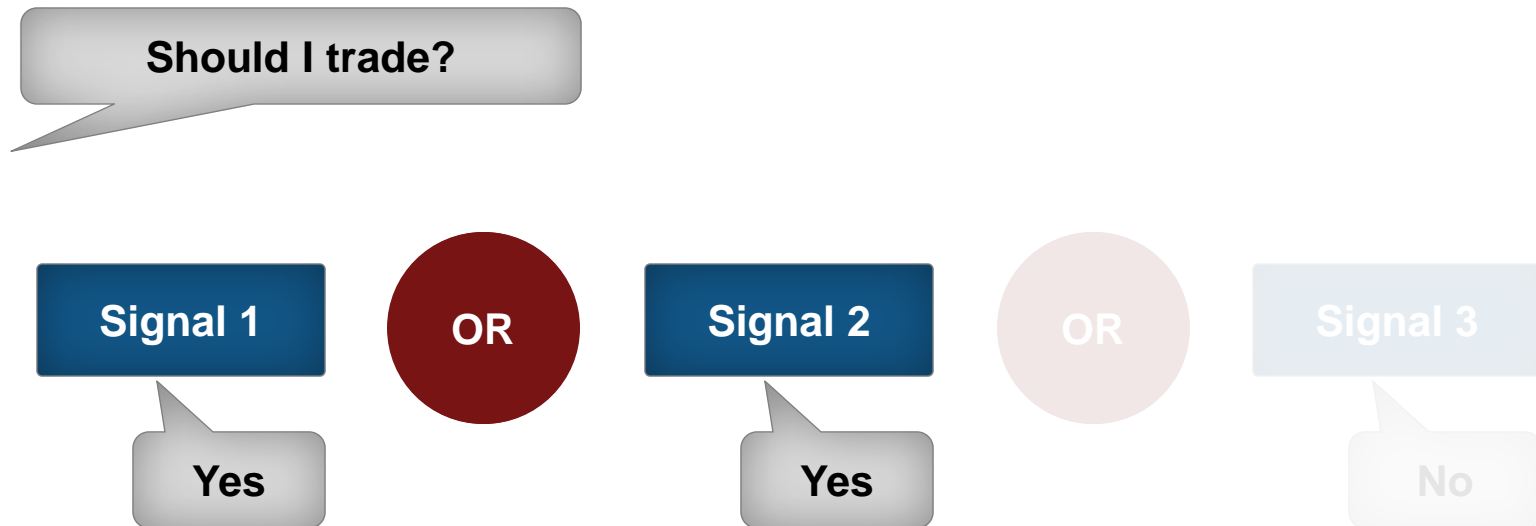

Key tasks

Key tasks

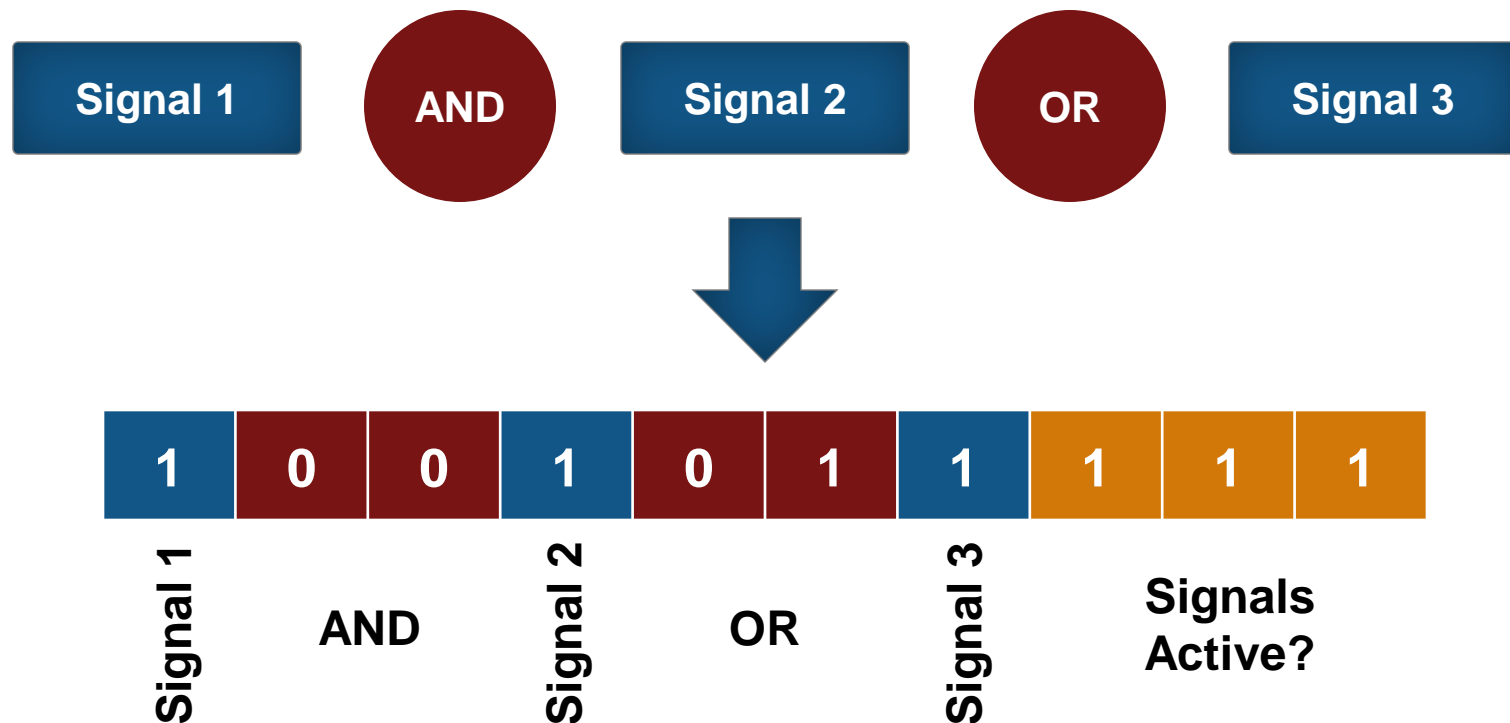

- Increase number of rules
- Incorporate advanced analytics to select best combination

Working with multiple strategies

Working with multiple strategies

- Represent different combinations as *bit strings*

Building Custom Evolution Algorithms

■ Selection

- *Retain* the best performing bit strings from one generation to the next. *Favor these for reproduction*

■ Crossover

- parent1 = [1 0 1 0 0 1 1 0 0 0]
- parent2 = [1 0 0 1 0 0 1 0 1 0]
- child = [1 0 0 0 0 1 1 0 1 0]

■ Mutation

- parent = [1 0 1 0 0 1 1 0 0 0]
- child = [0 1 0 1 0 1 0 0 0 1]

Key tasks

Key tasks

- Increase number of rules
- Incorporate advanced analytics to select best combination

Solutions

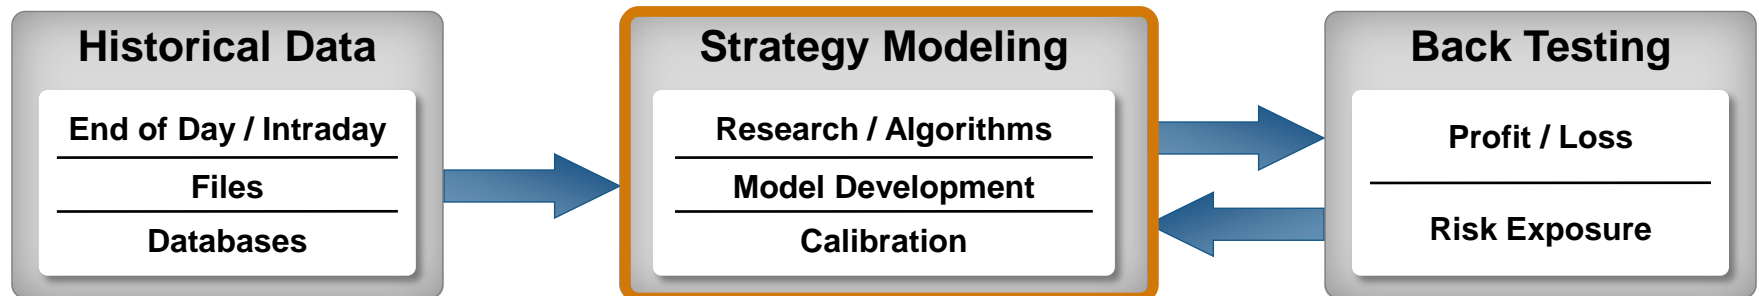

- High-level programming
- MATLAB Toolboxes: Global Optimization, ...

Task 3: Representing a real-time trading system

Goal: Integrate the trading decision engine into real-time simulation environment for “paper trading”

Development and testing

Implementation

Review: Requirements for the trading engine

- Sophisticated analytics
 - Custom rules & indicators
 - Non-traditional techniques
- Scalable speed
 - Higher frequency data
 - More trading rules
- Quick to develop and deploy
 - Try different strategies
 - Embed in trading engine

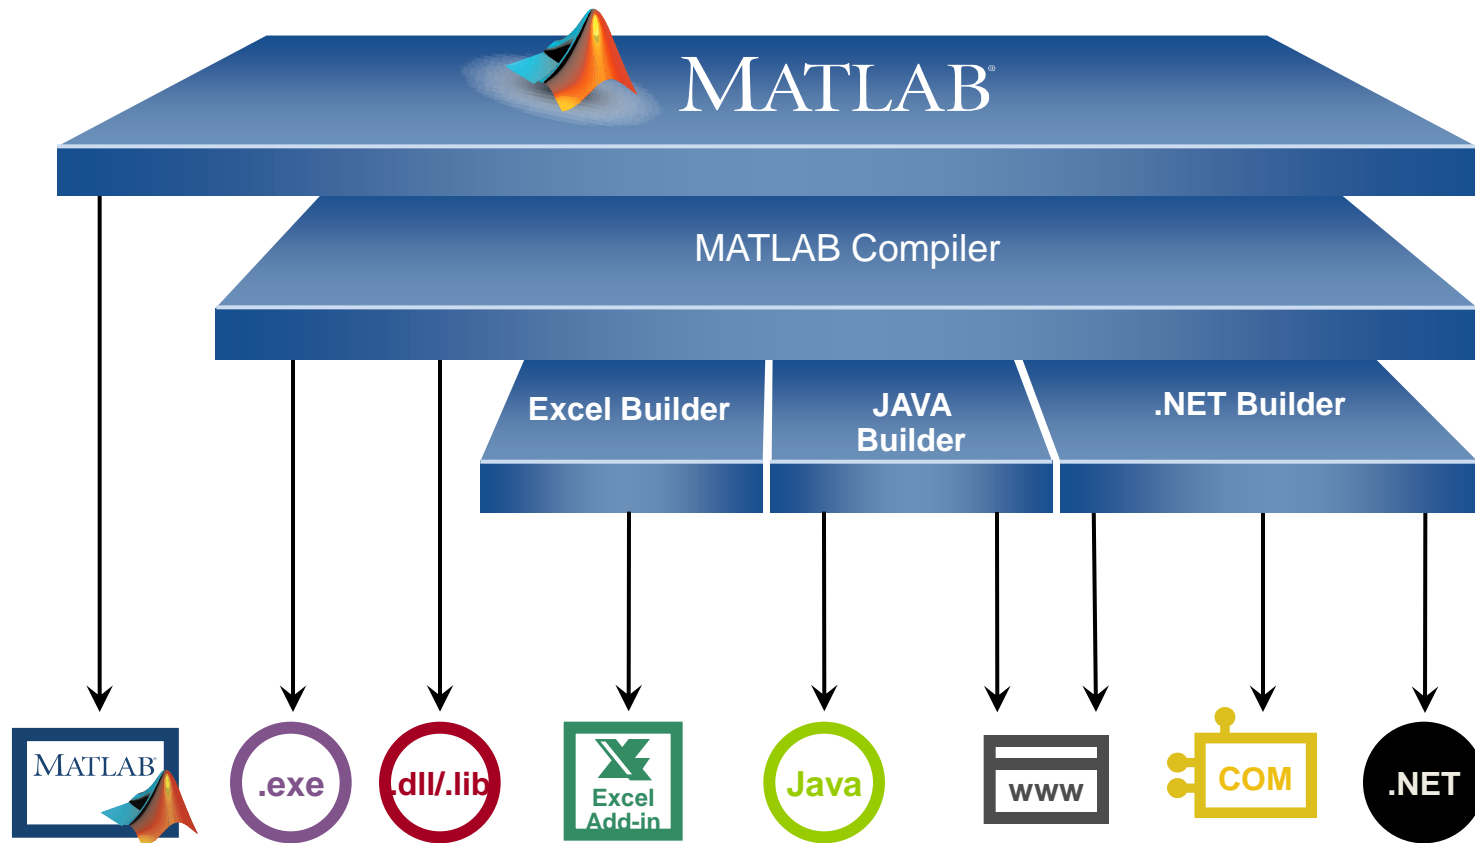

MATLAB's solutions

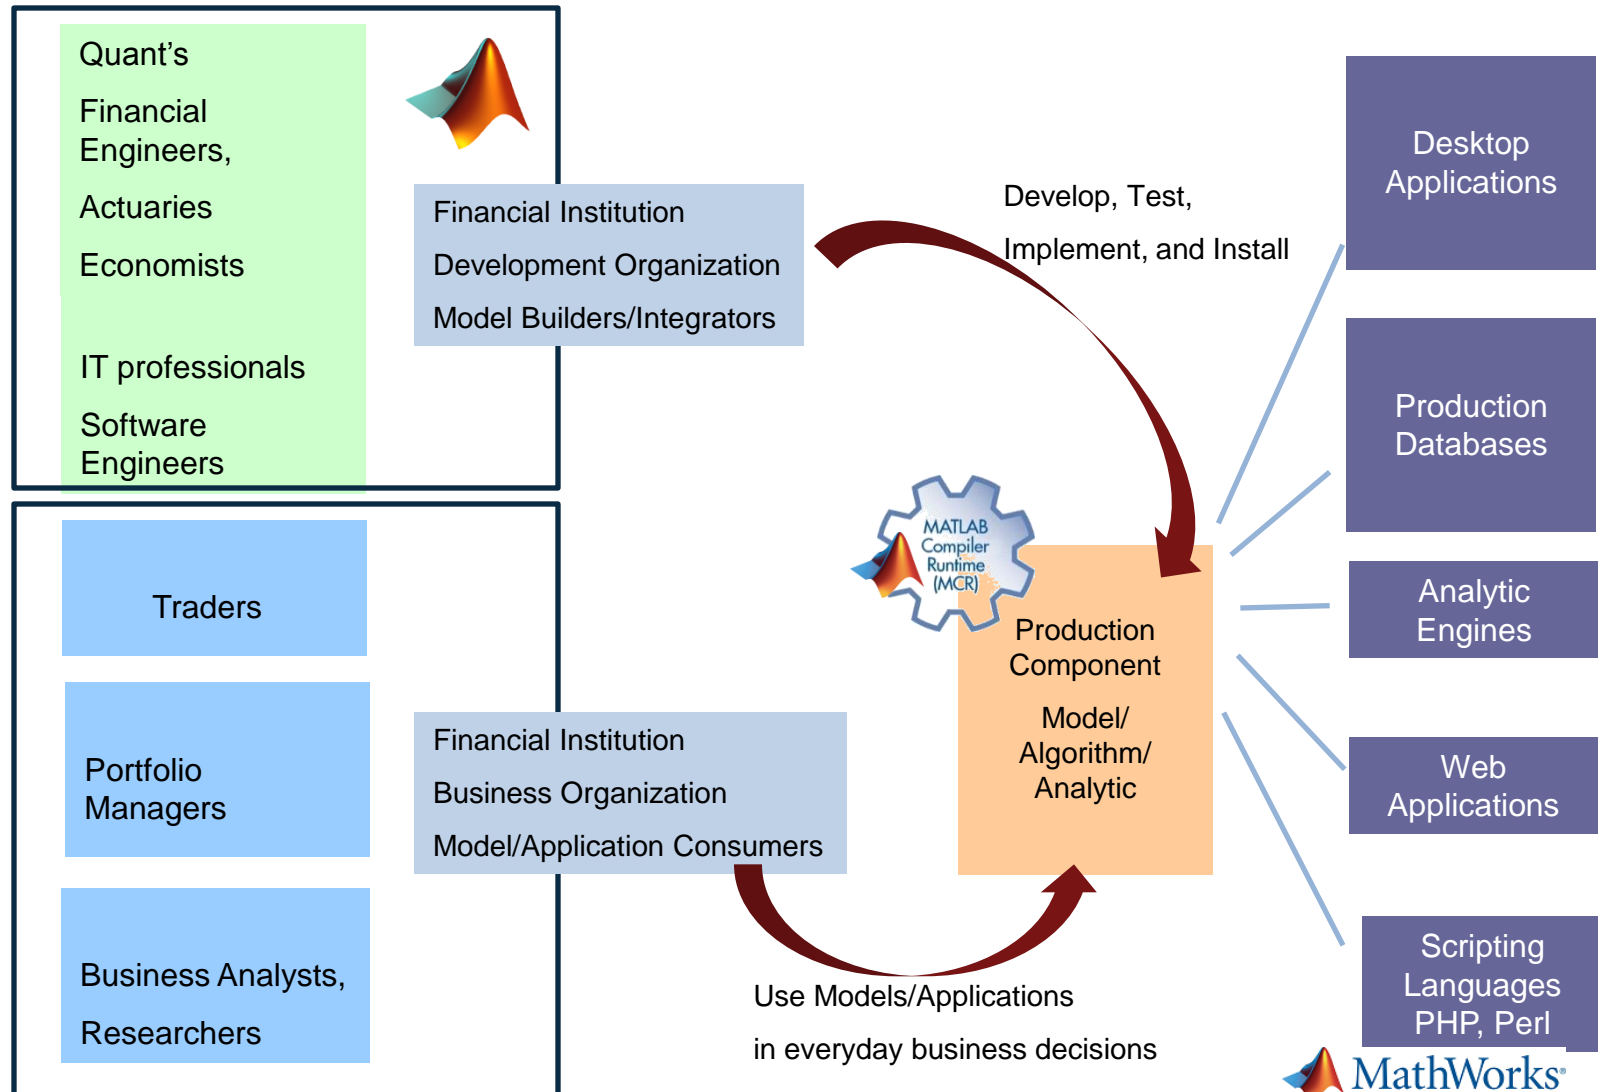

- **Sophisticated analytics**
 - Advanced graphics environment
 - Toolboxes give access to hundreds of new techniques
 - Flexible and customizable
- **Scalable speed**
 - Parallel computing solution
- **Quick to develop and deploy**
 - High-level programming
 - Automated deployment to desktop or server-based systems
